the facts.

Skin cancers are formed when skin cells are damaged by UV radiation penetrating the skin. Each cell carries DNA or genetic material that ‘tells’ the cell what it is, when to develop and when to die.

UV damages the skin cell DNA and this can cause them to mutate and grow abnormally. If these mutant cells are not destroyed by the body’s natural defense systems, they will continue to develop and can turn into skin cancers.

The diagram below shows the relationship between UV exposure and the effects it has on skin cells. Constant sun exposure and DNA damage has a lasting effect on your skin and your health. Ultimately, the more sun exposure, the higher the risk of DNA damage.

Cancer Council Automotive Window Film provides maximum UPF 50+ protection to virtually eliminate the penetration of harmful UV rays through your vehicle’s windows.*

* Ultraviolet Protection Factor of 50+ is the highest rating available in Australia. Independent testing shows Cancer Council automotive film screens out 99% of UV rays.

the benefits.

Introducing maximum UPF 50+ protection. Invisible Protection.

Cancer Council now offers a clear film for vehicle owners who want all the protection of UPF 50+ protection rating, and protection from damage to their skin cells DNA, but don't want a tinted film look. UV Clear also utilises Opti-View®, a patented technology that delivers new standards in 'haze free' optical technology by reducing distortion and ensuring safer driving.

Please ask us for more information about how UV Clear can keep you and your family protected.

- Helps reduce damage to your skin cell's DNA
- Dramatically reduces UV exposure associated with increased risk of skin cancer
- Helps hold shattered glass together in the event of an accident
- Provides 'invisible protection' without the tinted window look
